Oct 22, 2017 I was infected with WinXP two times at home, one time on Win7 at work and one on vista at home....(really) References Category:Anti-spyware software Category:Utilities for WindowsQ: How to determine the equation of a hyperbola with finite poles. I have to determine the equation of the hyperbola with finite poles; and I've seen that in each cartesian plane there is a point  $O$  which satisfies the equation:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ . A hyperbola is an example of a conic section, and indeed, some conic sections have finite poles, for example ellipses. I found many articles and they explain how to determine the equation of a hyperbola with infinite poles, for example this one, but I didn't find any article or proof showing how to compute the equation of a hyperbola with finite poles. I think it is easier to understand if I explain my problem a little more: Imagine I have the unit circle  $\mathbb{S}^1$  and I draw on it several points which has the property that the line  $y=x$  passes from  $A$  to  $B$  in those points. Imagine I draw also another circle  $\mathbb{S}^1$  and I draw on it these points too, but the line  $y=x$  passes from  $A'$  to  $B'$  in those points. Now, the first circle represents the hyperbola with finite poles, and the second one is the hyperbola with infinite poles. How can I determine the equation of the first hyperbola when I know the coordinates of the points on  $\mathbb{S}^1$ ?
